And yet he hardly appreciates the knowledge, experience, and judgment necessary to bring such a work to a satisfactory close. Time was when all of the details of such structures were determined by guesswork, but the developments in science and mathematics have changed all that. Formulas for the various types of stresses have been worked out; constants for every known material have been collected; and a multitude of diagrams and tables contribute to making the engineer's work as precise as a bookkeeper's balance. The strength and size of every rivet and the length and cross section of every girder in a steel structure are figured so they will bear the strains put upon them. The design of a masonry dam, the strength of the concrete mixture, and the amount of steel reinforcement are all mathematically determined in order to safely restrain the given volume of water behind it. The final judgment, therefore, as to the size of every part of the structure - must depend upon the designer's knowledge of Strength of Materials. The treatment of Strength of Materials, as found in standard textbooks, is so clothed in abstruse mathematics that it is impossible for the average trained man to obtain a working knowledge of the subject.
